bag of words

Supervised machine learning algorithm:

- ☐ Linear regression
- ☐ Decision trees
- ☐ SVM regression
- ☐ k-NN regression
- ☐ Ensembles (random forests, XGBoost)
- ☐ Artificial neural nets (deep learning)

$$y = f_{\theta}(x) = f_{\theta}(x_1, \dots, x_5)$$

$$y = \theta_0 + \theta_1 \cdot x_1 + \theta_2 \cdot x_2 + \dots + \theta_5 \cdot x_5 + \epsilon$$

Natural Language Processing: Term Frequency (TF) and sentiment analysis

examples (news articles)

$$\text{TF} = \frac{\text{Word Frequency}}{\text{number of words in document}}$$

All bears are lovely
Our tea was bad
That bear drinks with bear
The bear drinks tea
We love bears

features (TF)

target

1/2	0	1/2	0	0	56%
0	1/2	0	1/2	0	-35%
2/3	0	0	0	1/3	-5%
1/3	1/3	0	0	1/3	4%
1/2	0	1/2	0	0	63%
x_1	x_2	x_3	x_4	x_5	y

Supervised machine learning algorithm:

- ☐ Linear regression
- ☐ Decision trees
- ☐ SVM regression
- ☐ k-NN regression
- ☐ Ensembles (random forests, XGBoost)
- ☐ Artificial neural nets (deep learning)

$$y = f_{\theta}(x) = f_{\theta}(x_1, \dots, x_5)$$

$$y = \theta_0 + \theta_1 \cdot x_1 + \theta_2 \cdot x_2 + \dots + \theta_5 \cdot x_5 + \epsilon$$

Natural Language Processing: TF-IDF and sentiment analysis

TF-IDF is short for “term frequency–inverse document frequency”

$$\text{tf-idf}(t, d, D) = \text{tf}(t, d) \cdot \text{idf}(t, D)$$

where **tf** is “term frequency” and **idf** is “inverse document frequency”.

$$\text{tf}(t) = \frac{\text{word } t \text{ frequency}}{\text{number of words in document}}$$

$$\text{idf}(t) = \log \frac{\text{total number of documents}}{\text{number of documents with term } t \text{ in it}} = \log \frac{N}{|\{d \in D : t \in d\}|}$$

with

- N : total number of documents in the corpus $N = |D|$
- $|\{d \in D : t \in d\}|$: number of documents where the term t appears (i.e., $\text{tf}(t, d) \neq 0$).

There are a number of variants for **tf** and **idf** weights.

For the example in next page, we use word frequency as term frequency and the following equation to calculate **idf**. This is also the default of **TfidfVectorizer** in Python.

$$\text{idf}(d, t) = \log \left[\frac{1 + N}{1 + \text{df}(d, t)} \right] + 1$$

Natural Language Processing: TF-IDF and sentiment analysis

examples (news articles)
